XML is a subset of SGML, and has somewhat similar capabilities. The XML data model is based on the DTD, document type definition. In XML a document is called an instance. XML is used in, for example, an XHTML document, in XML Schema, and by both LightSwitch and Silverlight Data Services. XML is also used to transmit various types of data (such as patents, cheques, vouchers, invoices, etc.) and in applications (such as word processors, spreadsheets, etc.) to manage data. RTF is a standard file format used for text and word processing documents. This file format is similar to the format used by Word.
