Contents show] AutoCAD Features The main purpose of AutoCAD is to help users design and create construction drawings. These drawings can be used in various industries, such as architecture, engineering, surveying, packaging, and manufacturing. AutoCAD is a 2D CAD application. It is designed to operate on a PC or laptop computer. It does not require any kind of network connection and works even if the computer is disconnected from the Internet or any form of network. It supports both 2D and 3D drafting and plotting and provides many different types of tools and features to help users in their work. AutoCAD supports layer editing. This means that if you are working on a complex drawing, you can separate the layers of the drawing and work on them separately. You can view the work of the other users and the changes made to the drawing during a session. You can undo or redo a certain change. Different views, editing modes, and layers are maintained during the editing process and can be seen at a glance. The basic features of the AutoCAD program are outlined below: 2D / 3D drawing Support for industry-specific formats AutoCAD allows you to view and edit 2D and 3D drawings and create 2D construction drawings. All drawings are editable, and you can add, modify, and delete layers. You can add and edit the name of each layer and also move, edit, and delete the layers. The layers are maintained as you work on the drawing. You can also easily access your drawings stored in AutoCAD's libraries. T[] oldList = new T[3]; T[] newList = ??? I have tried the below with no success. T[] newList = oldList.Select(p => p).ToArray(); I was thinking something like this, but don't know how to get the T[] to a new one. T[] oldList = new T[3]; T[] newList = oldList.Select(p => { T[] new = new T[3]; new.Add(p); return new; }).ToArray(); Or would I need to convert first to a List then to an array? A: You need to declare your variable as a T[]. Then you can simply use new List(oldList).ToArray() var oldList = new List(3); var newList = oldList.ToArray(); ToArray() will create a new array. If you want to convert it to a list, call ToList(). The overall goal of this research is to develop a novel and efficient technique to restore normal function of retinal ganglion cells (RGCs) in the retina. Our hypothesis is that cell replacement by endogenous RGCs is an excellent therapeutic approach to treat the devastating loss of visual function in patients with RGC degenerative diseases such as glaucoma and optic neuritis.
