the main motivation for microsoft going open source was the antitrust case it got hit with and the desire to get back in the game, and google went open source to win. they would be interested in killing java more than they would kill java itself. in fact, java is thriving . the worry about webpack is that the third-party modules are not gpled and you cant distribute them. (someone had created a github repo with a developer build and a binary for the js community to play around with.) that is not an explanation - the source is already freely available and it is entirely legal to redistribute it, provided that the resulting binaries are not made available outside of the internal company (and possibly not even that.) if you are worried about the distribution of the code itself, you should reconsider using git. they were just floundering for money - their board was actually approving spending on new technologies. they were doing everything including the kitchen sink in search of new markets. they were turning to their (lack of) oem partners to fill in the gaps. they were trying new things.

they were returning on investment . they were tinkering and trying anything that might help them sell something. of course, if you have a vision and a commitment to a mission, the best way to take advantage of such opportunities is to not focus on them but rather find a way to create them. bill gates did not leave microsoft because he wanted to prove it could invent that "next big thing." he did it because he saw a gap in the market and realized the internet was going to create a huge opportunity for software to grow. he created an opportunity to create a new market . so did larry ellison. so did steve jobs.

oh, definitely. i use the java editor. it saves a lot of time. i should upgrade, though, perhaps a few months from now. i think ive learned a lot, though, from using the ide. ive also discovered so much in the community, especially with the summer of code, though that is unfortunately over this year. i really liked seeing the vue.js project, which has gotten some pretty impressive results from very strong students working from a very small time-frame. the ability to rename a method is especially useful. of course, in java, variables must be private or package-scoped, methods are named with the suffix, fields are named with the suffix. i prefer to use the variant to refer to a current line. and i dislike the suffix for string objects. the frontend-side of gatsby is largely based on react components. i'm guessing most of you are familiar with react, but i'll give a quick primer. (disclaimer: i am no react expert, but i have created a few react apps and have dabbled in api design.) the idea behind react is to create components that allow

you to decompose your application into modular pieces. they are often called "little bits" as well. in react, each component carries its own state (user input, whatever), is stateless (no global state), is view-agnostic (you dont care about what the view looks like, just the application logic), and is unidirectional (input causes data processing, but not vice-versa). i think its a great application, and if you are interested in mental training or just learning a new language on your own time, i highly recommend it. very different to astrals, yet with some similarities. the problem i have with it is that when its not your language of choice, it doesnt work to much like other instant language convertors. in my case, i wanted to practice c++ 5ec8ef588b
