While not creating and saving RAW images, Lightroom can open a RAW file in the new version. Lightroom 5 lets you also import Camera RAW files into a new project assuming the name "RAW." A newly built-in RAW Editor gives you much more control over spot removal and the flattening settings. In other words, you can now adjust white balance, sharpening, and shadow curves for individual RAW files. In addition, the EXIF/IPTC data viewer has been updated to let you view and edit these metadata automatically, almost as if you were using a standalone metadata editor. Such a feature can be very helpful when the images have a large number of details and complex EXIF data. In the past, Photoshop was originally designed to work on a Mac OS. However, the latest release is also supported by Windows, and Lightroom 5 does run fine on a Windows machine. I have tested Photoshop 5 on an old and new Mac and on Windows Vista and Windows 7. Overall, even though the library size has increased (the catalog is larger), Lightroom 5 is not slow at all. It's still snappy, even after editing 10,000 images, and it never gets slow due to the amount of data being processed. I think that all the additional features and functions made it way too large, which is something that will be necessary to get used to. This is probably one of Adobe's biggest strength on its products. I am not saying that the interface (or, at least, its general layout) has been made worse, because it's not really apparent. The new version is quite similar to its preceding version in terms of its layout though it's more well organized. However, as I alluded to before, it's much more spacious and less cluttered than Lightroom 4. It's amazing how light it feels on my virtual Mac desktop.

How to choose the best camera for you personally. However, the short version of it is if you are going to shoot professional portraits then you may want to consider an SLR camera. If you are just taking random photos of your family or friends at events for pleasure, then you may want to consider a point and shoot camera. For web browsing purposes, you may want to upgrade. Let's be honest, the web is no place for a slow

processor. Obviously, some of the graphics content isn't the best quality - but you have to be able to scroll the web without your browser hanging on a site. But you'll spend a lot of time in Photoshop and so you really need a great keyboard. Why not get one you actually like? I mean, some people are created to live off their keyboards and so a large book or mousepad keyboard may be appropriate. Personally, I think that any old keyboard will do and having the ability to change those keys or get new ones with the upgrades you're going to have makes a world of difference. I would also strongly suggest getting a separate mouse - especially if you are using a tablet or invest in a Bluetooth mouse! That way you can change all the buttons and remove cables - as well as freezing the tablet and removing your stylus.

In the same way that keyboards have their own design, mice do too. Have a look at what popular mouse there is on the market. Do you think you will want that mouse? You can get a number of different extensions to make Photoshop even more powerful on its own. For example, the Envision suite of extensions is installed and are free to use. Along with the Envision set of extensions are several great photography set of tools, which function as video compositing and other utils. For example, the Denoise tool will soften your photos and even give a bit more control by adjusting different light patterns. 933d7f57e6
